Seven Stages of Ageing on Horseback

From the barn grapevine:

Stage 1: Fall off pony. Bounce. Laugh. Climb back on. Repeat.

Stage 2: Fall off horse. Run after horse, cussing. Climb back on by shimmying up horse's neck. Ride until sundown.

Stage 3: Fall off horse. Use sleeve of shirt to stanch bleeding. Have friend help you get back on horse. Take two Advil and apply ice packs when you get home. Ride next day.

Stage 4: Fall off horse. Refuse advice to call ambulance; drive self to urgent care clinic. Entertain nursing staff with tales of previous daredevil stunts on horseback. Back to riding before cast comes off.

Stage 5: Fall off horse. Temporarily forget name of horse and name of husband. Flirt shamelessly with paramedics when they arrive. Spend week in hospital while titanium pins are screwed in place. Start riding again before doctor gives official okay.

Stage 6: Fall off horse. Fail to see any humor when hunky paramedic says “You again?” Gain firsthand knowledge of advances in medical technology thanks to stint in ICU. Convince self that permanent limp isn’t that noticeable. Promise husband you’ll give up riding. One week later purchase older, slower, shorter horse.

Stage 7: Slip off horse. Relieved when artificial joints and implanted medical devices seem unaffected. Tell husband that scrapes and bruises are due to gardening accident. Pretend you don’t see husband roll his eyes and mutter as he walks away. Give apple to horse.

Trust me. Despite a lack of bounce-ability, aging on horseback isn’t so bad, as long as you know what lies ahead. And as long as you keep your sense of humor.

Equine Pythiosis: Unsightly, Deadly, and Spreading

by: Stacey Oke, DVM, MSc
April 22 2011, Article # 18146
thehorse.com

If your horse doesn’t live in a tropical or subtropical region, you’ve most likely never had to worry about equine pythiosis, a relatively rare and sometimes fatal skin infection that causes tumorlike masses and ulcerated lesions in horses. But researchers have noted recently that the disease is now also affecting horses in cooler, drier climates--indicating that it’s becoming more widespread and is an affliction more horse owners need to be aware of.

According to Leonel Mendoza, MSc, PhD, an associate professor in the Department of Microbiology at Michigan State University, who recently completed a review on the disease, equine pythiosis is a rare infection caused by a funguslike microorganism called *Pythium insidiosum*. The infection, typically found in tropical and subtropical climates, has recently been diagnosed farther north than usual, appearing in drier states such as Arizona, California, and Washington state. The reason for the geographic spread of the disease remains unknown.

The causative agent resides in standing water or moist soil and finds its way into small wounds on a horse’s legs, lower abdomen, chest, or face, causing large, tumorlike masses that ulcerate. These itchy lesions contain necrotic (dead) tissue with a characteristic strong odor and draining tracts, and they contain stony masses called “kunkers” at their core.

Once considered a rare infection in the United States, pythiosis is a noncontagious disease with hundreds of cases reported annually in dogs and horses, and few cases in humans (one to two per year). Mendoza notes that there have been no reports of animal-to-animal or animal-to-human (or vice versa) transmission of the disease.

An increased interest in or recognition of the disease has accompanied its spread and some researchers have described the disease as “emerging.” However, other authorities on the subject, including Mendoza, disagree, noting that the disease was described as early as 1884 in India.

Early Action Key to Successful Treatment

No breed, age, or sex predilection appears to exist, so all horses have a similar risk for contracting the disease. If pythiosis is suspected in a horse that begins to develop lesions in the described areas, veterinarians advise testing for the disease (via blood test or biopsy) as quickly as possible. Long-standing (chronic) cases are less likely to respond to treatment than cases that are caught promptly (generally within two weeks).

A treatment technique called immunotherapy (referred to by the researchers as vaccination) is reportedly associated with a very high success rate. Researchers on one study reported that 72% of 18 horses recovered completely from pythiosis following vaccination (Mendoza notes, however, that most of these horses had undergone other treatment modalities in addition to the

vaccination, including surgery to excise the lesion, or administration of various drugs such as antifungal agents). Thus, the chance of curing a horse with the vaccine alone remains unclear.

“Despite this, immunotherapy remains the first choice for the management of equine pythiosis in the USA,” said Mendoza.

He noted that although *P. insidiosum* is not a fungus, veterinarians sometimes turn to antifungal agents as treatment; however, these drugs are not associated with a high success rate.

Researchers have noted that radical surgery, including limb amputation, is still the only treatment option in many cases, but many patients (about 55%) die despite surgical intervention.

Although a surefire preventive technique remains elusive, veterinarians suggest that practicing good wound care techniques and attempting to keep horses away from standing water or moist soil might aid in preventing infection.

The review, “*Pythium insidiosum*: an overview,” was published in *Veterinary Microbiology* in November 2010. The abstract is available online at www.ncbi.nlm.nih.gov/pubmed/20800978.

Five Cheese Chicken (in a Dutch Oven)

Serves 4

- 2 whole chicken breasts, skinned - deboned - split
- 4 slices mozzarella cheese
- 4 slices Swiss cheese
- 1/2 cup ricotta cheese
- 1 tablespoon Parmesan cheese
- 1 egg yolk
- 1 egg, well beaten
- 1/3 cup bread crumbs
- 1 tablespoon oil
- 1 tablespoon butter

CHEESE SAUCE:

- 2 tablespoons butter
- 2 tablespoons all-purpose flour
- 1 1/4 cups milk
- 1/2 teaspoon Worcestershire sauce
- dash Tabasco sauce
- 2 tablespoons dry sherry
- 1 cup cheddar cheese
- salt and pepper

COOKING INSTRUCTIONS:

1. Place chicken halves between pieces of plastic wrap. Flatten with mallet to form thin cutlets.
2. Place a slice mozzarella and Swiss cheese on each cutlet.
3. Mix ricotta and Parmesan cheeses with egg yolk. Divide among cutlets, placing a spoonful at the wide end of each cutlet.
4. Roll-up from the wide end. Roll each in flour, dip in egg and coat with bread crumbs. Secure with toothpicks.
5. Brown chicken on both sides in hot oil and butter. Arrange in a pre heated Dutch oven.
6. Bake at 350 degrees for 20 minutes.

CHARCOAL HINTS: Use 8 briquettes underneath and 10 on the lid.

CHEESE SAUCE PREPARATION:

1. Melt butter in sauce pan.
2. Stir in flour. Add milk, cook, stirring until thick.
3. Add Worcestershire sauce, Tabasco, sherry and cheddar cheese.
4. Salt and pepper to taste.
5. Serve over the top of chicken.
